The invention relates to a method of identifying a binding partner for synaptic vesicle protein 2 (SV2), involves incubating SV2 protein with levetiracetam and a potential binding partner and determining if the potential binding partner modulates the binding of levetiracetam to the SV2 protein or fragment, thus identifying a binding partner for the protein. The method is useful for identifying a binding partner for synaptic vesicle protein 2 and the identified binding partner for for tradting epilepsy, epileptogenesis, seizure disorders, convulsions, depression, anxiety, cerebral ischaemia, myotonia, stroke, Tourette's syndicme, neonatal cerebral haemorrhage, Parkinson's disease, Alzheimer's
                            Identifying binding partner for synaptic vesicle protein 2 (SV2) for treating epilepsy, Parkinson's disease, Alzheimer's disease, involves determining binding partner which modulates binding of levetiracetam or its analog to SV2 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      disease and dementia. The present sequence represents the amino acid sequence of the human synaptic vesicle protein 2, SVOP.
                                                                                                                                                          Disclosure; SEQ ID NO 8; 63pp; English.

The invention relates to a novel method for treating a neurological disorder associated with synaptic vesicle function, endocrinopathy or hormonal disease which comprises administering a compound or agent that condulates a function or activity of an SV2 (synaptic vesicle protein.) Protein. The method of the invention has anticonvulsant, neuroleptic, or antimanic, antidepressant, tranquiliser, antimagraine, analgesic, cerebroprotective, vasotropic, vulnerary, muscle relaxant, nacmotatic, neuroprotective, antimagraine, analgesic, cerebroprotective, vasotropic, vulnerary, muscle relaxant, notropic, condocrine and antidabetic applications. The method may be useful for treating a neurological disorder, endocrinopathy or hormonal disease associated with synaptic vesicle function. The neurological disorder is chosen from selutery, parkinson's disease, Alzheimer's disease, cognitive disease and dementia. The endocrinological disorder is neurodegenerative disease and dementia. The endocrinological disorder is chosen from endocrinopathies involving hypersecretion or hyposecretion of at least one hormone, gigantism, dwarfism, adrenal-medulla-related that of the human synaptic vesicle protein OP (SVOP) of the invention. 0; Gaps ., 30.0%; Score 6; DB 8; Length 548; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                The invention relates to a novel method for the enantiomeric conversion of amines. The method comprises treating a homochiral amine or a mixture of amine enantioners with an enzyme capable of catalyshing oxidation of the amine in a stereoselective manner and, subsequently or simultaneously, treating with a reducing agent. A further method of the invention is useful for directing the evolution of an amine oxidation enzyme e.g., microbial monoamine oxidase (MAO), preferably Aspergillus niger monoamine oxidase or its variant. This method is also useful for increasing the enantioselectivity of an amine oxidase enzyme. The enantioselective amine oxidase enzyme of the invention is useful in deracemization of amines This sequence represents a variant Aspergillus niger monoamine oxidase protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "The wild-type residue of Asn is substituted with Ser"

Enantiomeric conversion of amines comprises treating a homochiral amine or mixture of amine enantiomers with enzyme capable of catalyzing oxidation of amine and subsequently or simultaneously treating with a reducing agent

Claim 24; SEQ ID NO 2; 43pp; English

The invention relates to a novel method for the enantiomeric conversion of amines. The method comprises treating a homochiral amine or a mixture of amine enantiomers with an enzyme capable of catalyshing oxidation of the amine in a stereoselective manner and, subsequently or simultaneously, treating with a reducing agent. A further method of the invention is useful for directing the evolution of an amine oxidation enzyme e.g., microbial monoamine oxidase (MAO), preferably Aspergillus niger monoamine oxidase or its variant. This method is also useful for increasing the enantioselectivity of an amine oxidase enzyme. The enantioselective amine oxidase enzyme of the invention is useful in deracemization of amines. This sequence represents a variant Aspergillus niger monoamine oxidase protein of the invention.

These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium and identifying a homologue of a gene derived from acids, nucleic acids, socharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in
of amines. The method comprises treating a homochiral amine or a mixture of amine enantioners with an enzyme capable of catalysing oxidation of the amine in a stereoselective manner and subsequently orthat or simultaneously, treating with a reducing agent. A further method of the invention is useful for directing the evolution of an amine oxidation enzyme e.g., microbial monoamine oxidase (MAO), preferably Aspergillus niger monoamine oxidase or its variant. This method is also useful for increasing the enantioselectivity of an amine oxidase enzyme. The denatioselective amine oxidase enzyme of the invention is useful in deracemization of amines. This sequence represents the wild type Aspergillus niger monoamine oxidase protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a news and notice.

This invention describes novel polymucleotides that encode membrane synthase and membrane transport proteins from Corynebacterium glutamicum. The polymucleotides are isolated from a nucleic acid library of C. glutamicum then mutated at the specially Corynebacterium glutamicum. Use that express the polymucleotides are used for containing vectors that express the polymucleotides are used for production of fine chemicals, preferably amino acids and specifically lyaine, but more generally nucleotides, nucleosides, lipids, fatty acids, diols, carbohydrates, aromatic compounds, vitamins, co-factors and enzymes. These are used in the food, animal feed, cosmetics and pharmaceutical industries. The polymucleotides, optionally as primers and probes, can also be used for identification and classification of C. probes, can also be used for identification and classification of C. glutamicum and related species, e.g. for diagnosis, for genomic mapping, functional or evolutionary studies, gene manipulation and modulation of metabolic activity. Cells that containing the polymucleotides of the invention may produce fine chemicals in better yields, with higher productivity and/or more efficiently. NOTE: This sequence is not represented in the printed specification but is available in electronic formations.
                                                                                                                    0

    G. glutamicum membrane transport and synthesis-associated protein #39.

                                                                                                                                                                                                                                                                                                                                                                                                                                                         fine chemical production; lysine production; nucleotide; nucleoside; lipid; fatty acid; diol; carbohydrate; aromatic compound; vitamin; co-factor; enzyme; food; animal feed; cosmetic; pharmaceutical; gene;

The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them The sequences are useful in diagnosis and planucleotides encoding them The sequences are useful in diagnosis and theraphological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, of for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant or production of P. aeruginosa caused components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but, was obtained in electronic format from USPTO at

```
The present invention describes a predictor set comprising a plurality of polymucleotides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase compared to the activity of cells, comprising obtaining a sample of cells, pathway. Also described: (1) predicting whether a compound is capable of modulating the activity of cells, comprising obtaining a sample of cells, correlating the extression of the markers to the compound's ability to correlating the extression of the markers to the compound's ability to correlate what compound sensitivity or resistance of cells associated with a disease state, and (3) identifying polymucleotides and polypeptides whose expression levels correlate with a disease state, and (3) identifying polymucleotides and polypeptides that predict compound sensitivity or resistance of cells associated with a disease state, compounds, analysing the expression pattern of a microarray of polymucleotides that predict the sensitivity or resistance of cells associated with a disease state, opplyapptides, and selecting to polymucleotides or polypeptides that predict the sensitivity or resistance of cells associated with a disease state by using the expression pattern of the microarray. The polymucleotides and cervistes of cells associated with a disease state by using the corpounds that interact with protein tyrosine kinase pathways. These may be used in determining drug sensitivity in patients to allow the development of individualized cancer; based on patient response at a molecular level. The present corporation cancer; based on patient response at a molecular level. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0

These were derived from expressed sequence tags (BSTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a protein of the invention

AAF71753 to AAF72330 encode the Corynebacterium glutamicum metabolic pathway (MP) proteins given in AAB79634 to AAB80211. The C. glutamicum MP nucleic acids are useful for the production of fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, purine and pyrimidine bases, nucleosides, nucleotides, lipids, saturated and unsaturated fatty acids, diols, carbohydrates, aromatic compounds, vitamins, cofactors, polyketides and enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids from Corynebacterium glutamicum encoding metabolic pathway proteins, useful for producing fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, and purine and pyrimidine bases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Haberhauer G;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform adoteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mizoguchi H, Ando S, Hayashi M, Ochiai K, Yokoi H;

receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA3730 represent PCR primers and hybridisation probes used in the isolation of the PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Secreted and transmembrane proteins and nucleic acids designated PRO, useful as hybridization probes, in chromosome and gene mapping and gene
    New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions.
                                                                                        to AAA37144 encode the new isolated human transmembrane,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ferrara N,

 The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                          PRO polypeptide; mammal; tumour; cancer; human; cattle; horse; sheep; dog; cat; pig; goat; rabbit; tumour necrosis factor alpha; TNF-alpha; blood; chondrocyte cell; cell proliferation; cell differentiation; colon; adrenal; lung; breast; prostate; rectum; cervix; liver; genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          28-MAY-1998;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   04-JUN-1998
04-JUN-1998
        Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention.

The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal early a control sample of normal cells, whereby a higher level of and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, the proliferation or differentiation of fondrocyte cells. The proliferation of determine the presence of tumours and also susceptibility to tumour development, particularly afternal, unng, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian cervical, cervical, or liver tumours, in mammalian cells subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0;
                                                                                                                                                                                                             Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumors, such as prostate and breast tumors, in mammals and to screen for modulators of the compounds.

                        transmembrane polypeptides) and the PRO polypeptides 'setzeru and transmembrane polypeptides on a method for stimulating the release of The invention also relates to a method for stimulating the release of tumour necrosis factor alpha (TNF-alpha) from human blood by contecting the blood with a sequence of the invention, a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the proliferation or differentiation of chondrocyte cells by contacting the tumour in a mammal. The polypeptides and polymucleotides are useful for the manufacture of a medicament for diagnosing or treating a tumour in a mammal. Sequences ABUBSST8-ABUBSSB2 represent human PRO polypeptides of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .,

TITLE OF INVENTION: Rice Nucleic Acid Molecules and Other Molecules Associated With
TITLE OF INVENTION: Plants and USes Thereof for Plant Improvement
FILE REFERENCE: 38-21 (53221) B
CURRENT APPLICATION NUMBER: US/10/437,963
CURRENT FILING DATE: 2003-05-14
NUMBER OF SEQ ID NOS: 204966
SEQ ID NO 134324
LENGTH: 240
                                                                                                                                                                                                                                                                                                                                                                                                                      0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .
                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
